

What is claimed is:

1. An automatic internet communication device, characterized in a configuration having a mouthpiece, which is enabled through connection to input/output ports of a computer, whereby, upon an on-line communication system or software administrative staff linking-up,
5 the mouthpiece actualizes convenience of establishing on-line network communication.
2. The automatic internet communication device as claimed in claim 1, wherein the mouthpiece comprises an in-coming signal prompt device,
10 which triggers a music prompt upon receiving an in-coming signal, and allows a user to set time period the music prompt plays as well as adjust sound volume, and record or edit whatever sound the user wishes the music prompt to play.
3. The Automatic internet communication device as claimed in claim 1,
15 wherein the mouthpiece and a keyboard are configured as a single unit, and an input/output resource of the keyboard provides required electric power.
4. The automatic internet communication device as claimed in claim 1, wherein the keyboard and mouthpiece are configured as a transmitter
20 terminal and a receiver terminal respectively, thereby establishing

wireless communication.

5. The automatic internet communication device as claimed in claim 1,
wherein the mouthpiece is configured with a cutover switch, thereby
enabling cutover of accepting or refusing on-line network
5 communication link-up.
